## Google Fonts

- Alternative approach
- Link to a Google stylesheet
- Free to use; easy to code

<http://www.google.com/fonts>

# Review

- Pseudo classes for styling hypertext
  - :link
  - :visited
  - :active
  - :hover

```
a:link
{color:#888888;
 text-decoration:none;}

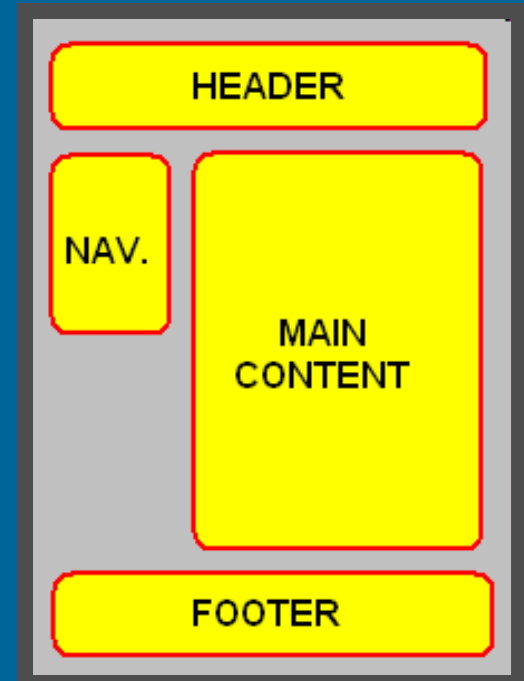

a:visited
{color:#333333;}

a:active
{color:#959596;}

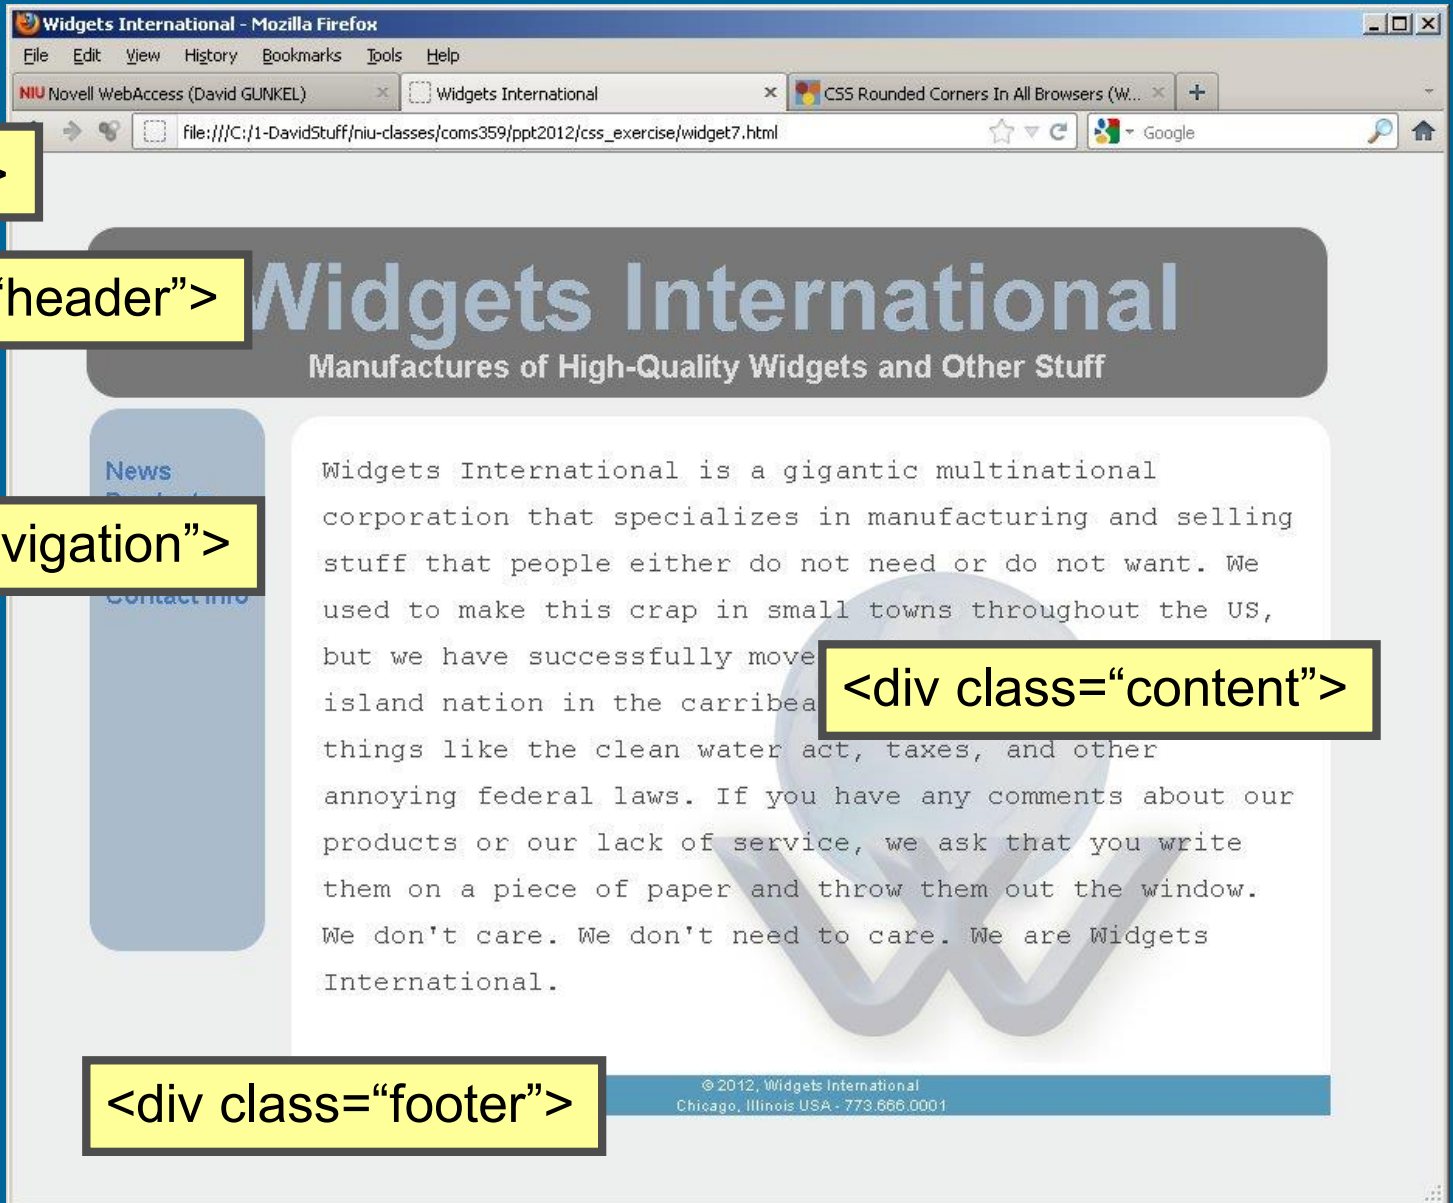

a:hover
{color:de3020;
 text-decoration:underline;}
```

# HTML5 Layout

- Page Layout with CSS
  - Use `<div>` tags to identify different parts of the html document
  - Apply style to these `<div>` elements in the stylesheet by creating different classes
  - Position the `<div>` elements by using positioning

`<body>`

`<div class="header">`

`<div class="navigation">`

`<div class="content">`

`<div class="footer">`

<body>

<div class="header">

<div class="content">

<div class="navigation">

<div class="footer">

# HTML5 Layout

- New Elements

- `<header>`
- `<article>`
- `<nav>`
- `<footer>`

## **Purpose/Benefit**

- Structure the html document without having to use multiple `<div>` tags
- Semantic data useful for web 2.0 applications like data mashups and content aggregators
- `<div>` is content neutral and generic; the new HTML 5 tags designate not only structural page elements but their meaning within the page content.

.js

# Context / Note

- COMS 359 – JavaScript basics
  - Introduce JavaScript
  - Get you started using JavaScript
- We will not, however, be able to provide complete treatment of JavaScript
  - This requires an entire course
  - Covered in COMS 469

# JavaScript Basics

- Topics
  - What JavaScript is and what it isn't
  - What JavaScript can do and what it can't
  - JavaScript Terminology

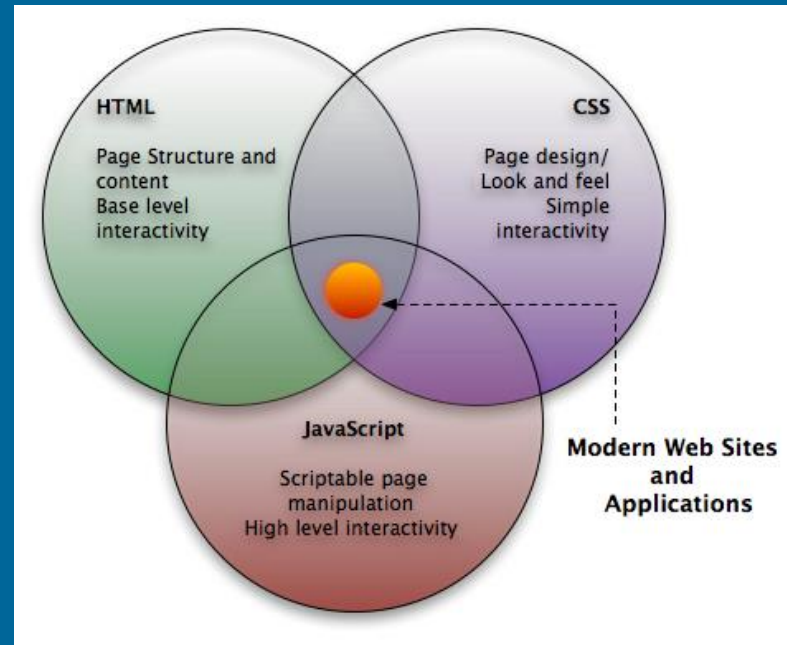

# JavaScript Basics

- History
  - JavaScript was introduced in 1995 by Netscape
  - Originally it was called *LiveScript*
  - Changed name to *JavaScript* in order to capitalize on the popularity of Sun's Java

# JavaScript Basics

- What JavaScript Is
  - Simplified programming language that is included in an HTML document
  - Object-oriented language designed to interface with HTML & CSS
  - Dynamic content and interactive features

# JavaScript Basics

- What JavaScript Is Not
  - JavaScript is not Java
    - Java is a full-featured, object-oriented programming language
    - JavaScript does employ some object oriented programming concepts
  - JavaScript is not a complete programming language
    - It is not compiled; it is embedded in an HTML document
    - It has no stand-alone output functions; it can only use the output functions of the browser

# JavaScript Basics

- What JavaScript Can Do
  - Control browser features
  - Modify document appearance
  - Modify document content
  - Store and use information about the user
  - Interact with applets
  - Manipulate images
  - React to state of browser and client system

# JavaScript Basics

- What JavaScript Can't Do
  - Four areas where JavaScript lacks power
    - No built-in graphical abilities
    - Can't read or write files on the user's system
    - Limited networking support; only supports downloading of content of a specific HTML document
    - No multithreading - CPU cannot multitask

# JavaScript Basics

- Terminology
  - JavaScript is an Object-Oriented language
  - Object-Oriented Terminology
    - Object
    - Properties
    - Methods

```
object-orientation
function Part(name,cost) { // constructor is the class
  this.name=name; // define and initialize properties
  this.cost=cost; // "this" is always explicit ☺☺
};

var partBolt=new Part("bolt",1.99); // instantiation
assert(partBolt.constructor == Part); // type test
assert(partBolt instanceof Part); // ancestry test

assert(Part.prototype.isPrototypeOf(partBolt)); // type test
assert(typeof(partBolt) == "object"); // not a type test
assert(partBolt.name == "bolt" && partBolt.cost == 1.99);
var partNut=new Part("nut",0.10);
assert(partNut.name == "nut" && partNut.cost == 0.10);

Part.prototype.description=function() { // methods
  return this.name + " $" + this.toFixed(2);
}
assert(partBolt.description() == "bolt $1.99");
assert(partNut.description() == "nut $0.10");
// Whatever the prototype contains, all instances contain:
Part.prototype.toString=function() { return this.name; }
assert(partBolt.toString() == "bolt");
var a=[partBolt,partNut]; assert(a.join() == "bolt,nut");

Part.prototype.sort=function(i,r) { // class method
  return i.cost - r.cost;
}
a.sort(Part.prototype.sort); assert(a.join() == "nut,bolt");

function WoodPart(name,cost,tree) { // inheritance
  Part.apply(this, [name,cost]); // base constructor call
  this.tree = tree;
}
WoodPart.prototype=new Part(); // clone the prototype
WoodPart.prototype.constructor = WoodPart;
var tpick = new WoodPart("toothpick",0.01,"oak");
assert(tpick.name == "toothpick");

assert(tpick instanceof Part); // proof of inheritance

var a=[partBolt,partNut,tpick]; // polymorphism sorts
assert(a.sort(Part.prototype.sort).join() == "toothpick,nut,bolt");
assert(a[0].tree == "oak" && a[1].tree == null);

assert(a[0] instanceof WoodPart);
assert(!a[1] instanceof WoodPart);

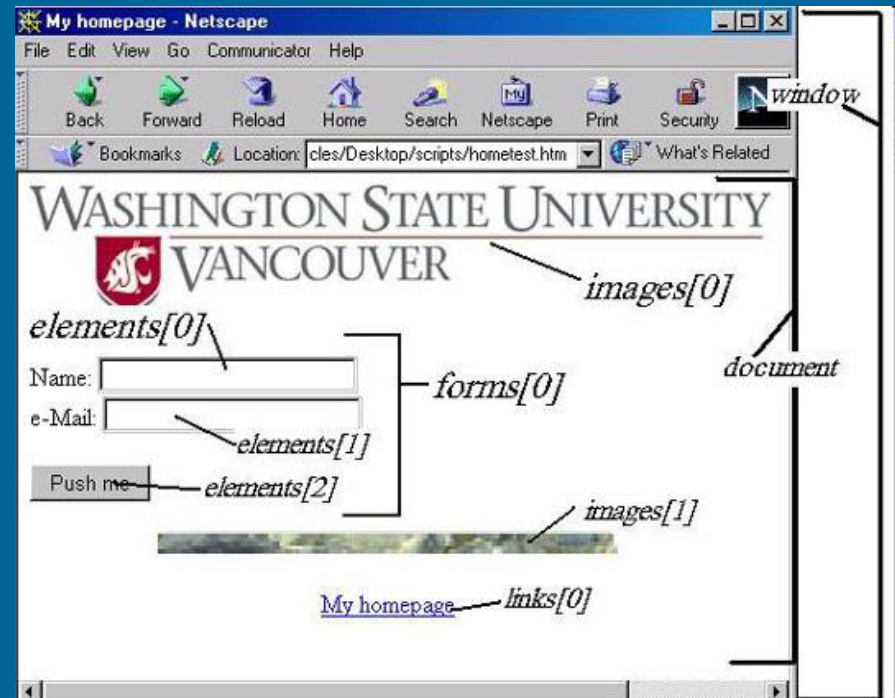

assert("tree" in tpick); // membership test - in operator
assert(!"tree" in partBolt);

WoodPart.prototype.description=function() { // override
  // Calling base class version of description() method:
  var dsc=Part.prototype.description.apply(this,[]);
  return dsc + " (" + this.tree + ")"; // and overriding it.
}
assert(tpick.description() == "toothpick $0.01 (oak)");
assert(partBolt.description() == "bolt $1.99");

assert(eval("2+2") == 4);
if (typeof(Error) == "function") { // Safe exception catching
  eval("try { dangerous(); } catch (e) { oops(e); }"); ★
}
}
```

# JavaScript Basics

- Terminology
  - Object = Web Browser Elements
    - Window
    - Document
    - Forms
    - Images

# JavaScript Basics

- Terminology
  - Properties
    - Items belonging to a web browser object
    - Further define an object; changing a property can alter the object
    - Examples
      - documents have titles
      - forms have checkBoxes
      - windows have a location

# JavaScript Basics

- Terminology
  - Methods = Object behaviors
    - Specifies what an object does or how it functions
    - Examples
      - Buttons `click( )`
      - Windows `open( )`
      - Documents `write( )`
    - the `( )` occurs with all JavaScript methods; often times additional information (called an argument) is placed inside the parenthesis

# JavaScript Basics

- Terminology
  - Events = actions the user performs
    - moving a mouse
    - submitting a form
  - Event Handlers
    - JavaScript commands that deal with user events

<u>Event</u>	<u>Event Handler</u>
Cursor moved over an object	onMouseover
Cursor moved off an object	onMouseout
User submitted a form	onSubmit
User left the window	onUnload

# JavaScript Basics

- Terminology
  - Objects, Properties, Methods and Event Handlers are put together to create instructions
  - *Dot-Syntax*
    - Object.property
      - document.bgColor
      - window.status
    - Object.method( )
      - document.write( )

# JavaScript Object Table

Complete list of all JavaScript objects & their associated properties, methods, and event handlers

## Appendix A

Table A.3

OBJECT	PROPERTIES	METHODS	EVENT HANDLERS
Array	length	concat join pop push reverse shift slice sort splice toLocaleString toString unshift	none
body	alink background bgColor bgProperties bottomMargin leftMargin link nowrap rightMargin scroll scrollLeft scrollTop text topMargin vlink	createTextRange	onBlur onClick onDoubleClick onFocus onHelp onKeyDown onKeyPress onMouseDown onMouseMove onMouseOut onMouseOver onMouseUp onResize onScroll
Button	form name type value	blur click focus handleEvent	onBlur onChange onClick onDoubleClick onFocus onHelp onKeyDown onKeyPress onKeyUp onMouseDown onMouseMove onMouseOut onMouseOver onMouseUp onSelect
Checkbox	checked defaultChecked form name type value	blur click focus handleEvent	onBlur onChange onClick onDoubleClick onFocus onHelp onKeyDown onKeyPress onKeyUp onMouseDown onMouseMove onMouseOut onMouseOver onMouseUp onSelect
Date	none	getDate getDay getFullYear	none

# JavaScript Basics

- Case Sensitivity
  - HTML is not case sensitive
    - `<html>` = `<HTML>` = `<Html>`
  - JavaScript is case sensitive
    - `bgColor`  $\neq$  `bgcolor`  $\neq$  `BgColor`  $\neq$  `BGCOLOR`

# JavaScript Basics

  <title>Javascript Basics</title>
</head>
<body style="color:#2255aa; f
  <script language="javascri
    document.write("Hello W
  </script>
</body>
</html>
```

## HTML Embedded

JavaScript is included in the HTML document - `<head>` or `<body>`

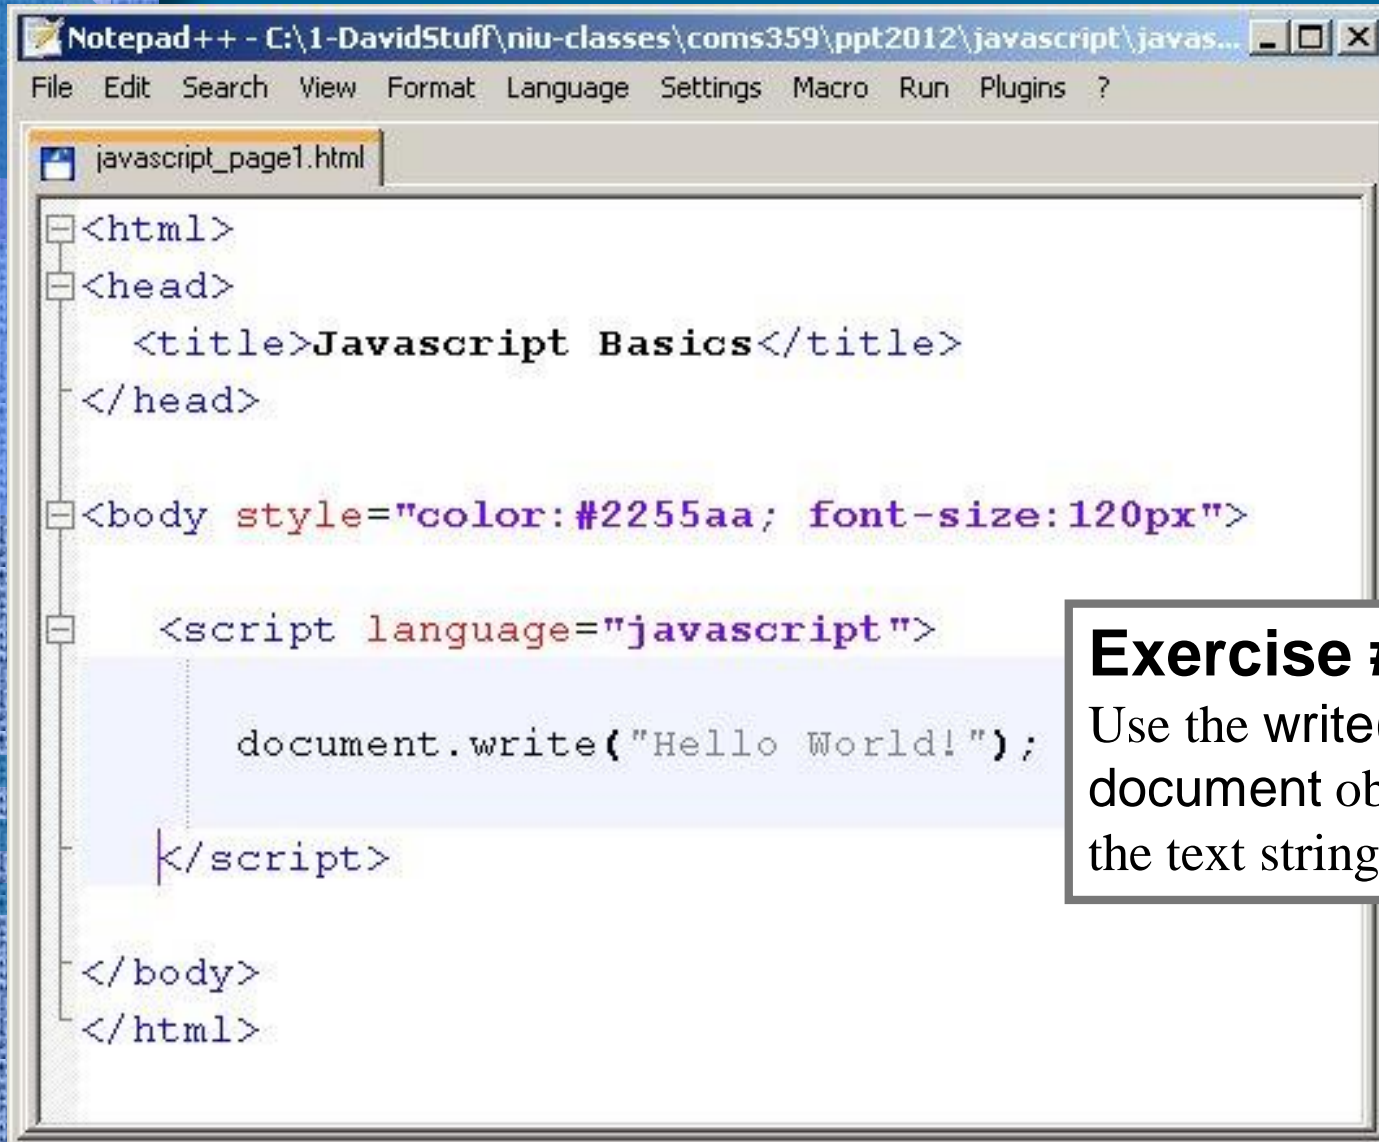

## `<script>` tag

Differentiate JavaScript code from HTML by using the `<script>` container tag. This tag has one required attribute, which specifies the type of scripting language.

`<script>` tells the browser to interpret the following lines of code as script and not as HTML

# JavaScript Basics

The image shows a Notepad++ window with the following code:

```
File Edit Search View Format Language Settings Macro Run Plugins ?
javascript_page1.html
<html>
<head>
  <title>Javascript Basics</title>
</head>
<body style="color:#2255aa; font-size:120px">
  <script language="javascript">
    document.write("Hello World!");
  </script>
</body>
</html>
```

## Exercise #1

Use the `write( )` method of the document object to write out the text string "Hello World!"

# JavaScript Application

- Objective
  - We will not have the time to consider every possible object, property, method and event handler
  - Instead we will look at a few common applications of JavaScript that are useful for web designers and learn about objects, properties, methods, and event handlers in the context of specific design tasks.
    - Alert Box
    - New Windows
    - Image Rollovers

# JavaScript Application

- Alert Box
  - User feedback
  - Function
    - Provide a warning
    - Alert the user about something

**<head>** Use the `alert( )` method to warn the user. The browser automatically generates an *alert* box.

```
<html>
<head>
  <title>Javascript Basics</title>

  <script type="text/javascript">

    alert("I will now erase your hard drive");

  </script>

</head>

<body style="color:#2255aa; font-size:40px">

  <script type="text/javascript">

    document.write("All files on C:/ have been erased");

  </script>

</body>
</html>
```

**<body>** Use the `write( )` method of the document object to display a message

**Parsing** - Because the `<head>` loads before the `<body>`, the script in the `<head>` will execute first, providing the alert box prior to displaying the body content.

```

</html>
```

Exercise #3

# JavaScript Application

- Image Rollovers
  - Function - images change when user places mouse on them
  - Purpose- provide user with feedback; images respond to user actions
  - Used for creating interactive menus and buttons

# JavaScript Application

- Rollover Requirements

- 1) Need a pair of images for each rollover button

- Regular **Enter**

- Highlighted **Enter**

- 2) Need to write an **Event Handler** that will swap the highlighted image for the regular image when the mouse is on top of the button and vice versa when the mouse is moved off the button

# JavaScript Application

- Rollover Development Process

- 1) Download buttons

- <http://gunkelweb.com/coms359/multimedia/rollover.html>
- Default File Names (do not change)
  - image1a.jpg **Enter**
  - image1b.jpg **Enter**

- 2) Write HTML Document

- Include JavaScript Event Handler

```
Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript_page4.html
File Edit Search View Format Language Settings Macro Run Plugins ?
javascript_page4.html
<html>
<head>
  <title>Javascript Basics</title>
</head>
<body>
  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">
    
  </a>
</body>
</html>
```

Begin with an anchor tag, because the button will be an active link to another page or site.

`<a href="http://www.niu.edu"`

```
Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript_page4.html
File Edit Search View Format Language Settings Macro Run Plugins ?
javascript_page4.html
<html>
<head>
  <title>Javascript Basics</title>
</head>
<body>
  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">
    
  </a>
</body>
</html>
|
```

Put an `<img>` tag inside the anchor container tag. The value of the `src` attribute will be the first image (`image1a.jpg`). This image is given an arbitrary but unique name – `image1`

Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript\_page4.html

File Edit Search View Format Language Settings Macro Run Plugins ?

javascript\_page4.html

```
<html>
<head>
  <title>Java
</head>
<body>
  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">
    
  </a>
</body>
</html>
```

Include two JavaScript event handlers inside the opening anchor tag. The formal syntax of these event handlers is:  
"object.name.src='imagefile'"

The onMouseover event handler inserts image1b.jpg, when the user places his/her mouse over the image.

The onMouseout event handler, inserts image1a.jpg, when the user moves the mouse off the image.

```
Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript_page4.html

javascript_page4.html
<html>
<head>
  <title>Javascript Basics</title>
</head>
<body>
  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">
    
  </a>
</body>
</html>
|
```

Exercise #4

# JavaScript Application

- Add a second button
  - Follow same procedure
    - A pair of images
    - Event handler to swap the highlighted image for the regular image, when the user moves over it.
  - Modifications
    - The second image will need a different name; the name connects the image to the proper document object specified in the event handler
    - The image names will be different

Exit

Exit

```
Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript_page5.html
File Edit Search View Format Language Settings Macro Run Plugins ?

javascript_page5.html

<html>
<head>
  <title>Javascript Basics</title>
</head>
<body>

  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">

    
  </a>
  <br>
  <a href="http://www.qunkelweb.com"
    onMouseover="document.image2.src='image2b.jpg'"
    onMouseout="document.image2.src='image2a.jpg'">

    
  </a>

</body>
</html>
|
```

Alter the name of the document object and change the value of the src to indicate the second set of images

```
Notepad++ - C:\1-DavidStuff\niu-classes\coms359\ppt2012\javascript\javascript_page5.html
File Edit Search View Format Language Settings Macro Run Plugins ?

javascript_page5.html

<html>
<head>
  <title>Javascript Basics</title>
</head>
<body>

  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">

    
  </a>
  <br>
  <a href="http://www.gunkelweb.
    onMouseover="document.image2.src='image2b.jpg'"
    onMouseout="document.image2.src='image2a.jpg'">

    
  </a>

</body>
</html>
|
```

Alter the src of the <img> and change the value of the name attribute

```

</head>
<body>

  <a href="http://www.niu.edu"
    onMouseover="document.image1.src='image1b.jpg'"
    onMouseout="document.image1.src='image1a.jpg'">

    
  </a>
  <br>
  <a href="http://www.gunkelweb.com"
    onMouseover="document.image2.src='image2b.jpg'"
    onMouseout="document.image2.src='image2a.jpg'">

    
  </a>

</body>
</html>
|
```

Exercise #5

# Summary

- JavaScript
  - Introduction to JavaScript
  - JavaScript Basics
  - Three common JavaScript Applications
- Project #3
  - Must include JavaScript
  - Alert box, Image rollover, new Window, etc.

# Preview
